The other parameters are given below: Matrix density ( $\rho_{ma}$ ) = 2.68 g/cc Fluid density ( $\rho_{fl}$ ) = 1.0 g/cc Compressional wave travel time in matrix ( $\Delta t_{ma}$ ) = 54 $\mu$ s/ft Compressional wave travel time in fluid ( $\Delta t_{fl}$ ) = 189 $\mu$ s/ft
	The calculated secondary porosity of the reservoir is % (rounded off to the nearest integer).
Q. 64	The <i>Waxman–Smits</i> equation to estimate water saturation for shally sands is given as, $C_t = \emptyset^{m^*} S_w^{n^*} \left( C_w + \frac{BQ_v}{S_w} \right)$ where, $B$ is cation mobility (m $\Omega^{-1}$ meq $^{-1}$ ml $^{-1}$ ), and $Q_v$ is cation exchange capacity per pore volume (meq ml $^{-1}$ ). The values of other parameters are:
	Porosity $(\emptyset) = 0.25$ $BQ_v = 17.0 \text{ m } \Omega^{-1}$ Cementation factor $(m^*) = \text{Saturation exponent } (n^*) = 2.0$ Resistivity of water $(R_w) = 0.05 \Omega \text{ m}$ True resistivity of formation in the oil zone $(R_t) = 12 \Omega \text{ m}$
	As per the given dataset, the calculated water saturation $(s_w)$ in oil zone is % (rounded off to the nearest integer).
